Wedgle®

Direct-Inject™

TREE INJECTION SYSTEM

Delivers proven results with less chemicals compared to foliage spray or soil drenching

- No guarding
- No return trips
- No mixing, spilling or spraying
- No waiting for uptake
- No drilling
- No drilling damage

Treat almost any tree in 5 minutes or less!

Conifers, palms, and some hardwoods may be injected using Portle or Palm Tips and the Tip Setter.

With an easy sliding action, the Tip Setter drives these heavier tips deep into the active areas of conifers and palms, or through the tough outer bark of some hardwoods.

Treat hundreds of trees non-stop.

Make up to 1,000 injections without reloading chemical with the High-Volume Kit. Simply attach the transfer line to the 1000 ml chemical pack and the Direct-Inject unit. Heavy-duty nylon backpack has padded shoulder straps and carrying handle.

Don’t Drill... Direct Inject!

Direct-Inject protects trees... Drilling damages trees...

1. Wedgle Direct-Inject System makes injections through the bark without drilling and without damaging sapwood.
2. Chemical is injected into the cambial zone where the tree can easily use it. (dyed red for visibility)
3. Injections requiring drilling damage the sapwood, disrupt nutrient movement, and cause permanent damage.
4. Drilled holes allow pest and fungus entry.

QUICK-CONNECT™ INJECTION TIPS

Original Wedgle® Tips
Ideal for most hardwoods, the Wedgle Tip features a patented wedge-shaped end which delivers chemical precisely to a tree’s cambial zone, the space between the bark and the outer ring of sapwood. Used with self-sealing WedgeCheks™ which keep chemical in the tree when tip is withdrawn.

Wedge Plus™ Tips
Same tip design, plus a check valve in the hub. Ideal when a larger quantity of chemical is being injected. Check valve lets you remove the injection unit from the tip so you can make other injections while letting the tree absorb chemical.

Portle® Tips
Ideal for injecting conifers, the Portle Tip has openings, or ports, along the length of the tip which inject chemical at multiple locations. A check valve in the hub of the tip keeps chemical in the tree while all injections are being made. Portle Tips are also useful for injecting difficult-to-treat hardwoods or when making late-season injections when most trees are harder to penetrate.

Palm Tips
The Palm Tip is a longer, heavier tip designed to penetrate a palm’s outer husk and deliver chemical deep into the inner active layers.

Quick-Connect Chemical Packs
Change chemical packs in a snap
120 ml chemical packs
Chemical packs snap on to injection unit QC coupler. No mixing. Air-free packs are easy to prime, empty completely, and work at any angle.

1000 ml chemical packs
Used with the High-Volume Kit. Same QC coupling systems as the 120 ml chemical pack. Not all chemicals are available in 1000 ml packs; ask your distributor for details.
